

Python Dictionaries

Dictionary

A dictionary is a collection which is **unordered, changeable and indexed**. In Python dictionaries are written with curly brackets, and they have keys and values.

Example

Create and print a dictionary:

```
thisdict = {
    "brand": "Ford",
    "model": "Mustang",
    "year": 1964
}
print(thisdict)
```

Accessing Items

You can access the items of a dictionary by referring to its key name, inside square brackets:

Example

Get the value of the "model" key:

```
x = thisdict["model"]
```

There is also a method called **get()** that will give you the same result:

Example

Get the value of the "model" key:

```
x = thisdict.get("model")
```

Change Values

You can change the value of a specific item by referring to its key name:

Example

Change the "year" to 2018:

```
thisdict = {
    "brand": "Ford",
    "model": "Mustang",
    "year": 1964
}
```

```
thisdict["year"] = 2018
```

Dictionary Length

To determine how many items (key-value pairs) a dictionary has, use the `len()` function.

Example

Print the number of items in the dictionary:

```
print(len(thisdict))
```

Adding Items

Adding an item to the dictionary is done by using a new index key and assigning a value to it:

Example

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
thisdict["color"] = "red"  
print(thisdict)
```

Removing Items

There are several methods to remove items from a dictionary:

Example

The `pop()` method removes the item with the specified key name:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
thisdict.pop("model")  
print(thisdict)
```

Example

The `popitem()` method removes the last inserted item :

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
thisdict.popitem()  
print(thisdict)
```

Example

The `del` keyword removes the item with the specified key name:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
  
del thisdict["model"]  
  
print(thisdict)
```

Example

The `del` keyword can also delete the dictionary completely:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
  
del thisdict  
  
print(thisdict) #this will cause an error because "thisdict" no longer exists.
```

Example

The `clear()` method empties the dictionary:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
  
thisdict.clear()  
  
print(thisdict)
```

Copy a Dictionary

You cannot copy a dictionary simply by typing `dict2 = dict1`, because: `dict2` will only be a *reference* to `dict1`,

and *changes made in `dict1` will automatically also be made in `dict2`.*

There are ways to make a copy, one way is to use the built-in Dictionary method `copy()`.

Example

Make a copy of a dictionary with the `copy()` method:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
mydict = thisdict.copy()  
print(mydict)
```

Another way to make a copy is to use the built-in function `dict()`.

Example

Make a copy of a dictionary with the `dict()` function:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
mydict = dict(thisdict)  
print(mydict)
```

Nested Dictionaries

A dictionary can also contain many dictionaries, this is called nested dictionaries.

Example

Create a dictionary that contain three dictionaries:

```
myfamily = {  
    "child1" : {  
        "name" : "Emil",  
        "year" : 2004  
    },  
    "child2" : {  
        "name" : "Tobias",  
        "year" : 2007  
    },  
    "child3" : {  
        "name" : "Linus",  
        "year" : 2011  
    }  
}
```

Or, if you want to nest three dictionaries that already exists as dictionaries:

Example

Create three dictionaries, then create one dictionary that will contain the other three dictionaries:

```
child1 = {
```

```

    "name" : "Emil",
    "year" : 2004
}
child2 = {
    "name" : "Tobias",
    "year" : 2007
}
child3 = {
    "name" : "Linus",
    "year" : 2011
}

myfamily = {
    "child1" : child1,
    "child2" : child2,
    "child3" : child3
}

```

Dictionary Methods

Python has a set of built-in methods that you can use on dictionaries.

Method	Description
clear()	Removes all the elements from the dictionary
copy()	Returns a copy of the dictionary
fromkeys()	Returns a dictionary with the specified keys and value
get()	Returns the value of the specified key
items()	Returns a list containing a tuple for each key value pair
keys()	Returns a list containing the dictionary's keys
pop()	Removes the element with the specified key
popitem()	Removes the last inserted key-value pair
setdefault()	Returns the value of the specified key. If the key does not exist: insert the key, with the specified value
update()	Updates the dictionary with the specified key-value pairs
values()	Returns a list of all the values in the dictionary
